Re: Software Product Builder - Enterprise Platform

Dear Ubiquiti Hiring Team,

I am applying for the Software Product Builder - Enterprise Platform position because it matches the way I build software: understand the existing workflow, clarify what should change, define the service and integration boundaries, ship a useful implementation, and validate it in an operating environment.

I bring more than 20 years of hands-on experience across enterprise applications, C#/.NET backend services, REST APIs, SQL-backed systems, integrations, cloud delivery, and live-system support. The strongest match for this role is my recent work on controlled Oracle PL/SQL and Pro*C API analysis and .NET migration planning. I used task decomposition, review gates, tests, progress visibility, and traceable evidence to make modernization work easier to understand and safer to deliver. I also correlated 398 APIs with 235 work records so that analysis, implementation planning, and verification could remain connected.

Alongside modernization work, I built an MCP-enabled Copilot Agent Skill that connects Jira, Confluence, API contracts, and repository context before generating reviewable engineering changes. I have also built repository-aware code-review and API-documentation agents, keeping permissions, structured output, human review, and operational handoff explicit. These workflows reflect the kind of platform thinking I would bring to an enterprise product team: make the boundary clear, make progress visible, and make the result useful to the people who operate it.

My recent cloud and AI delivery work includes OpenAI, RAG, OCR, Cloudflare Workers and Containers, R2, D1, Docker, Linux/SSH, and web dashboards. A Microsoft Teams Bot and OpenAB workplace-assistant foundation is part of that broader integration experience, but my primary focus remains enterprise platform modernization, API delivery, and reliable engineering workflow.

The Enterprise Platform role interests me because it combines backend services, APIs, administration, automation, cloud infrastructure, and production ownership. I would welcome the opportunity to contribute as a hands-on product builder who can work across legacy constraints and modern platform capabilities while keeping security and engineering judgment visible.

Thank you for your consideration. I would be glad to discuss how my experience could contribute to Ubiquiti.

Sincerely,

Eric Huang
